# 1 The Ring of Integers

## 1.1 The Set of All Integers

**Divisor** Let  $a$  and  $b$  be integers. We say that  $a$  is a divisor of  $b$  if there exists an integer  $k$  such that  $b = ka$ . If  $a$  is a divisor not equal to  $b$  we call it a proper divisor.

**Divisibility Properties** Let  $a, b, c \in \mathbb{Z}$ . Then

- a) If  $a \mid b$  and  $b \mid c$  then  $a \mid c$ .
- b)  $a \mid a$ .
- c) If  $a \mid b$  and  $b \mid a$  then  $b = \pm a$ .
- d) If  $a \mid b$  and  $a \mid c$  then  $a \mid (xb + yc)$  for any  $x, y \in \mathbb{Z}$ .

**Euclid's Theorem** There are infinitely many primes in  $\mathbb{Z}$ .

## 1.2 Ring

**Ring** A ring consist of a non-empty set  $R$  together with two operations defined on elements of  $R$ , addition (+) and multiplication (denoted by juxtaposition, or sometimes by  $\star$  or  $\times$ ) where all the following properties hold:

1. Closure under addition: if  $a, b \in R$  then  $a + b \in R$ .
2. Commutativity of addition: for all  $a, b \in R, a + b = b + a$ .
3. Associativity of addition: for all  $a, b, c \in R, (a + b) + c = a + (b + c)$ .
4. Zero element: There is an element  $0$  of  $R$  such that if  $a \in R$  then  $a + 0 = a$ .
5. Negatives.  $\forall a \in R$  there is  $-a \in R$  such that  $a + (-a) = 0$ .
6. Closure under multiplication: if  $a, b \in R$  then  $ab \in R$ .
7. Associativity of multiplication:  $\forall a, b, c \in R, (ab)c = a(bc)$ .
8. Distributive laws: for all  $a, b, c \in R, a(b + c) = ab + ac$  and  $(a + b)c = ac + bc$ .

**Subtraction** For any  $a, b$  in a ring  $R$ , we define  $a - b = a + (-b)$

**Ring Properties** Let  $R$  be a ring and  $a, b, c \in R$ . Then the following hold:

1. if  $a + b = a + c$  then  $b = c$ ;
2.  $0$  is unique and  $0a = a0 = 0$ ;
3. for each  $a$ ,  $-a$  is unique;
4.  $a - b = 0$  if and only if  $a = b$ ;

5.  $-(ab) = (-a)b = a(-b)$ ;
6.  $ab - ac = a(b - c)$  and  $ac - bc = (a - b)c$ .

**Commutative Ring** A commutative ring is a ring  $R$  in which multiplication is commutative, that is,  $ab = ba$  for all  $a, b \in R$ .

**Identity Element** An identity element in the ring  $R$  is an element, usually denoted by 1, with the property that  $1a = a1 = a$  for all  $a \in R$ . Sometimes we are more explicit and call 1 the multiplicative identity.

**Divisors of Zero** In a ring  $R$ , if  $a$  and  $b$  are non-zero elements such that  $ab = 0$ , then  $a$  and  $b$  are called divisors of zero.

**Integral Domain** An integral domain is a commutative ring with identity in which there are no divisors of zero. Explicitly, an integral domain is a non-empty set  $R$  together with operations of addition and multiplication, such that the ring axioms (1) - (8) hold as well as the following:

9. Commutativity of multiplication. If  $a, b \in R$  then  $ab = ba$ .
10. Identity element. There exists an element 1 of  $R$  such that if  $a \in R$  then  $1a = a$ .
11. No divisors of zero. For all  $a, b \in R$ , if  $ab = 0$  then either  $a = 0$  or  $b = 0$ .

**Cancellation Law for Integral Domains** Let  $R$  be an integral domain and  $a, b, c \in R$  and suppose  $a \neq 0$ . If  $ab = ac$  then  $b = c$ .

### 1.3 Divisibility in Commutative Rings

**Divisors in Rings** Let  $\alpha, \beta$  be elements in a commutative ring  $R$ . We say that  $\alpha$  is a divisor of  $\beta$ , denoted by  $\alpha \mid \beta$ , if there exists an element  $\kappa$  of  $R$  such that  $\beta = \kappa\alpha$ .

**Unit of Rings** Let  $R$  be a commutative ring with identity. An element of  $R$  having a multiplicative inverse is called a unit of  $R$ .

#### Associates, Irreducibles and Primes

- Elements  $a$  and  $b$  of an integral domain  $R$  are called associates if  $a = ub$ , for some unit  $u$  of  $R$ .
- An element  $\rho$  of the integral domain  $R$  is said to be irreducible if it has the property

$$\forall \alpha, \beta \in R, \text{ if } \rho = \alpha\beta \text{ then } \alpha \text{ or } \beta \text{ is a unit.}$$

- A non-zero, non-unit element  $\rho$  of the integral domain  $R$  is said to be prime if it has the property

$$\forall \alpha, \beta \in R, \text{ if } \rho \mid \alpha\beta \text{ then } \rho \mid \alpha \text{ or } \rho \mid \beta.$$

**Primes are Irreducible** In an integral domain every prime is irreducible.

**Greatest Common Divisor** Let  $a, b$  be integers, not both zero. Then a positive integer  $g$  is the greatest common divisor of  $a$  and  $b$  if and only if  $g$  is a common divisor and every common divisor is a factor of  $g$ .

**GCD in Rings** Let  $a, b$  be elements in a commutative ring  $R$ . An element  $g \in R$  is a greatest common divisor of  $a$  and  $b$  in  $R$  if  $g \mid a, g \mid b$  and every common divisor of  $a$  and  $b$  is a factor of  $g$ .

## 1.4 Ideals

**Ideal** Let  $R$  be a commutative ring with identity. A subset  $I$  of  $R$  is called an ideal of  $R$  if it has the following three properties:

- 0 is in  $I$ .
- If  $a, b$  are in  $I$  then  $a + b$  is in  $I$ .
- If  $a \in I$  and  $x \in R$  then  $ax \in I$ .

**Smallest Ideal** Let  $R$  be a commutative ring with identity, and  $\{a_1, \dots, a_n\} \subset R$ . Then the set

$$\{r_1 a_1 + \dots + r_n a_n : r_1, \dots, r_n \in R\}$$

is the smallest ideal of  $R$  containing  $\{a_1, \dots, a_n\}$ .

**Principal Ideal** An ideal  $I$  of a ring  $R$  is said to be principal if there exists  $a \in R$  such that  $I = \langle a \rangle = \{ax : x \in R\}$ .

**Every Ideal is Principal** Every ideal in  $\mathbb{Z}$  is principal. In particular, if  $a, b$  are not both zero then  $\langle a, b \rangle = \langle \gcd(a, b) \rangle$ .

**Principal Ideal Domain** A principal ideal domain is an integral domain in which every ideal is principal.

**Integral and Principal Ideal Domains** Let  $R$  be an integral domain.

- If  $R$  has a division algorithm then  $R$  is a principal ideal domain.
- If  $R$  is a principal ideal domain, then every non-zero element of  $R$  which is not a unit has a unique (up to associates and order) factorisation into irreducibles.

**Big-Oh and Little-Oh Notations** For two functions  $f(x)$ ,  $f : \mathbb{R} \rightarrow \mathbb{C}$ , and  $g(x)$ ,  $g : \mathbb{R} \rightarrow \mathbb{R}^+$ , we say that

- $f(x) = O(g(x))$  iff  $\limsup_{x \rightarrow \infty} |f(x)|/g(x) < \infty$  or, alternatively iff there is a constant  $c > 0$  such that  $|f(x)| \leq cg(x)$  for all sufficiently large  $x$ .

- $f(x) = o(g(x))$  iff  $\lim_{x \rightarrow \infty} |f(x)|/g(x) = 0$  or, alternatively, iff for any  $\epsilon > 0$  we have  $|f(x)| \leq \epsilon g(x)$  for all sufficiently large  $x$ .

**Prime Number Theorem (PNT)** For  $x \rightarrow \infty$ , we have

$$\pi(x) = \frac{x}{\log x} + o\left(\frac{x}{\log x}\right) = (1 + o(1))\frac{x}{\log x}.$$

## 2 Diophantine Equations and Congruences

### 2.1 Congruences

**Cancelling in Congruences** Let  $a, b, c$  and  $m$  be integers, with  $c \neq 0$ .

- The congruences  $cax \equiv cb \pmod{cm}$  and  $ax \equiv b \pmod{m}$  have the same solutions.
- If  $\gcd(c, m) = 1$  then the congruences  $cax \equiv cb \pmod{m}$  and  $ax \equiv b \pmod{m}$  have the same solutions.

**Multiplicative Inverse** Let  $a \in \mathbb{Z}_m$  and  $m \in \mathbb{Z}^+$ . If  $ax \equiv 1 \pmod{m}$ , we call  $x$  the multiplicative inverse of  $a$  modulo  $m$ , or the multiplicative inverse of  $a$  in  $\mathbb{Z}_m$ .

### 2.2 Arithmetic Functions

**Notation of Factors** For any positive integer  $n$  we define  $d(n)$  to be the number of (positive) factors of  $n$ , and  $\sigma(n)$  to be the sum of all (positive) factors of  $n$ .

**Formula for  $d(n)$**  If  $n \in \mathbb{Z}^+$  has canonical factorisation into prime powers  $n = p_1^{\alpha_1} p_2^{\alpha_2} \dots p_s^{\alpha_s}$  then

$$d(n) = (\alpha_1 + 1)(\alpha_2 + 1) \dots (\alpha_s + 1) = \prod_{k=1}^s (\alpha_k + 1)$$

**Formula for  $\sigma(n)$**  If  $n \in \mathbb{Z}^+$  has canonical factorisation into prime powers

$$\begin{aligned} n &= p_1^{\alpha_1} p_2^{\alpha_2} \dots p_s^{\alpha_s} \text{ then} \\ \sigma(n) &= (1 + p_1 + p_1^2 + \dots + p_1^{\alpha_1}) \dots (1 + p_s + p_s^2 + \dots + p_s^{\alpha_s}) \\ &= \prod_{k=1}^s \frac{p_k^{\alpha_k+1} - 1}{p_k - 1} \end{aligned}$$

**Multiplicative Functions** Suppose that  $f$  is a function with domain  $\mathbb{Z}^+$ . We call  $f$  multiplicative if

$$f(mn) = f(m)f(n),$$

whenever  $\gcd(m, n) = 1$ .

**$d, \sigma$  Multiplicative** Both  $d$  and  $\sigma$  are multiplicative.

**Perfect Numbers** A number  $n$  is called perfect if  $\sigma(n) = 2n$ .

**Euclid-Euler** Let  $n$  be even. Then  $n$  is perfect if and only if there is an integer  $k > 1$  such that  $n = 2^{k-1}(2^k - 1)$  and  $2^k - 1$  is prime.

## 3 Introduction to Groups

### 3.1 Fields

**Field** A field  $K$  is a commutative ring with identity in which every non-zero element has a multiplicative inverse.

**No Divisors of Zero in Fields** A field contains no divisors of zero.

**All fields are Integral Domains** A field is an integral domain.

**Inverse and GCD** An element  $n \in \mathbb{Z}_m^*$  has an inverse if and only if  $\gcd(m, n) = 1$ .

**Rings and Fields** The ring  $\mathbb{Z}_m$  is a field if and only if  $m$  is prime.

### 3.2 Units of a Ring

**Notation for Set of Units** In  $\mathbb{Z}_m$ , we denote the set of units by  $\mathbb{U}_m$ .

**Units in Commutative Rings with Identity** Let  $R$  be a commutative ring with identity.

- a) 1 is a unit of  $R$
- b) If  $a$  and  $b$  are units in  $R$ , then so is their product  $ab$ .
- c) If  $a$  is a unit in  $R$  then so is  $a^{-1}$

**Units are Closed in Commutative Rings with Identity** In any commutative ring with identity, the set of all units is closed under multiplication and inverse.

### 3.3 Groups

**Groups** A group is a non-empty set  $G$  on which an operation  $\star$  is defined, such that the following properties hold:

1. Closure: if  $a, b \in G$  then  $a \star b \in G$ .
2. Associativity: if  $a, b, c \in G$  then  $(a \star b) \star c = a \star (b \star c)$ .

3. Identity element: there is an element  $e$  of  $G$  such that for all  $a \in G$  we have  $a \star e = e \star a = a$
4. Inverses: for each  $a$  in  $G$  there is an element  $b$  of  $G$  such that  $a \star b = b \star a = e$ . This element is usually denoted  $a^{-1}$ .

**Abelian Groups** If the operation is commutative, i.e.  $a \star b = b \star a$ , for all  $a, b \in G$ , the group is called commutative, or Abelian.

**Properties of Groups** In any group  $G$  the following properties hold.

- a There is only one identity element in  $G$ .
- b Each  $x$  in  $G$  has only one inverse.
- c If  $x, y \in G$  then  $(xy)^{-1} = y^{-1}x^{-1}$ .
- d If  $x, y, z \in G$  and  $xy = xz$  then  $y = z$ .

### 3.4 Group Isomorphism

**Group Isomorphism** Let  $G$  and  $H$  be groups with operations  $\star$  and  $\bullet$  respectively. An isomorphism for  $G$  to  $H$  is a bijective function  $\psi : G \rightarrow H$  with the property that

$$\psi(a \star b) = \psi(a) \bullet \psi(b) \quad \text{for all elements } a, b \in G.$$

The groups  $G$  and  $H$  are said to be isomorphic if there exists such a function. We write  $G \cong H$  to indicate that  $G$  and  $H$  are isomorphic.

**Identities and Inverses in Isomorphic Groups** Suppose that  $G$  and  $H$  are groups with identities  $e_G$  and  $e_H$ , respectively. Let  $\psi : G \rightarrow H$  be a group isomorphism. Then

1.  $\psi(e_G) = e_H$ ,
2.  $\psi(a^{-1}) = (\psi(a))^{-1}$  for all  $a \in G$ ,
3.  $\psi(a^n) = \psi(a)^n$  for all  $n \in \mathbb{Z}$ ,
4. If  $\psi : G \rightarrow H, \theta : H \rightarrow K$  homomorphic then  $\theta \circ \psi : G \rightarrow K$  is also homomorphic,
5. If  $\psi : G \rightarrow H$  is a isomorphic then  $\psi^{-1} : H \rightarrow G$  is also isomorphic.

### 3.5 Wilson's Theorem

**Wilson's Theorem** Let  $p \geq 2$ . Then  $p$  is prime if and only if  $(p-1)! \equiv -1 \pmod{p}$ .

## 4 The Structure of $\mathbb{U}_m$ and $\mathbb{Z}_m$

### 4.1 Subgroups and Cyclic Groups

**Subgroup** Let  $G$  be a group, and let  $H$  be a subset of  $G$  which is itself a group under the same operations as  $G$ . Then we say that  $H$  is a subgroup of  $G$ .

**The Subgroup Lemma** Let  $G$  be a group and  $H$  a non-empty subset of  $G$ . Then  $H$  is a subgroup of  $G$  if and only if it is closed under the group operation and inverse.

**Cyclic Groups** A group  $G$  is said to be cyclic if there exists an element  $g \in G$  such that  $G = \langle g \rangle$ , i.e.  $G$  is generated by a single element.

**Order of a Group and Element** The order of a finite group  $G$  is the number of elements in  $G$ ,  $|G|$ .  
The order of an element  $g$  in a group  $G$  is the smallest positive integer  $n$  (if any) such that  $g^n = e$ . We write  $o(g)$  for the order of the element  $g$ .

**Distinct Powers of Elements** If  $g \in G$  has order  $n$ , then the elements  $e, g, g^2, \dots, g^{n-1}$  are all distinct.

**Isomorphic Cyclic Groups** Two finite cyclic groups are isomorphic if and only if they have the same order.

**Prime Order is Isomorphic is Cycle Group** Any group of prime order  $p$  is isomorphic to the cyclic group  $C_p$ .

**Groups of Prime Order are Abelian** Any group of prime order is abelian.

**All Subsets Closed under Operation are Subgroups** Let  $G$  be a group with operation  $\star$ . If  $H$  is a non-empty finite subset of  $G$  that is closed under  $\star$ , then  $H$  is a subgroup of  $G$ .

**Lagrange's Theorem** If  $G$  is a finite group and  $H$  is a subgroup of  $G$ , then  $|H|$  is a factor of  $|G|$ .

**Left Coset** Let  $G$  be a group and  $H$  a subgroup of  $G$ . For any  $g \in G$  we define the left coset of  $H$  by  $g$  to be

$$gH = \{gh \mid h \in H\}.$$

If we used additive notation we would write a coset of  $H$  as  $g + H$ .

**Order of Elements in a Group is a Divisor of the Group** Suppose  $G$  is a group of finite order and  $g \in G$ . Then  $g^{|G|} = e$ .

**Fermat's Little Theorem** If  $p$  is a prime and  $a$  is not a multiple of  $p$ , then  $a^{p-1} \equiv 1 \pmod{p}$ .

**Corollary of Fermat's Little Theorem** If  $p$  is prime and  $a$  is any integer, then  $a^p \equiv a \pmod{p}$ .

**Euler's Theorem** Let  $n$  be a positive integer, and let  $a$  be an integer relatively prime to  $n$ . Then  $a^{\varphi(n)} \equiv 1 \pmod{n}$ .
